CRUSHERS

MATERIAL REDUCTION EQUIPMENT

Hammerking HSI

The Rocktec Hammerking Impact Crusher is an economical secondary / tertiary crusher which manufactures a well graded cubical product for a wide range of industries. The Hammerking is a simple machine to operate and maintain - all parts are easily accessed and changed when worn.

Hammers rotate for extra life. No special foundations are required and the Hammerking can be driven from almost any type power plant. The Hammerking is ruggedly built and will give many years of reliable service under the most arduous conditions.

Feed material enters the Hammerking through the rear opening and is picked up by the hammers and flung against the inside of the casing. Material is then carried down past the control plate and broken again before exiting through the rock box.

The two row hammer configuration allows a full charge of feed to be picked up, increasing the amount of material in the casing. This has the benefits of even hammer wear, better power usage and a large degree of semi-autogenous (rock-on-rock) crushing, which saves wear parts.

Reduction ratio is altered by:

- · Moving the control plate
- · Changing the rotor speed

Generally speaking light, friable materials can be crushed and shaped with comparatively low power and rpm, but dense, tough materials require higher power and rpm. The Hammerking range of impact crushers are built to exacting standards and all wear items are standard Kumbee parts, available from most foundries.

Refurbished VSI

Rocktec have bought and traded old VSI Crushers that have been suitable only for scrap and completely rebuilt them to new standards and specifications. This has provided an effective solution for the customer without the high capital cost of a new machine.

Rocktec also rebuilds VSI's for customers wishing to up-grade their existing machines which would have otherwise ended up becoming obsolete.

SPECIALIST CRUSHING EQUIPMENT

Rocktec can design and manufacture specialist crushing equipment to achieve specific customer objectives. Specialist Crushing Equipment includes the processing of the following materials: **BARK | BATH | COAL | FERTILISER**

HSI Basecourse Impactor

The Rocktec HSI Basecourse Portable is specifically designed to produce a saleable Basecourse product from a maximum of 150mm feed. The unit can feed to screen or crusher and features heavy duty screens and conveyors. All Rocktec's portable units are suitable for tough conditions and can be designed to suit specific site requirements and to integrate with existing plant where possible. Most are able to be designed road legal. Standard portable crusher features include heavy duty construction, patented proven designs, fast set up, high quality components, full back up and service.

Rolls Crusher

Rocktec's range of double roll crushers are designed and manufactured to meet specific customer requirements. The crushing action reduces the amount of fines production. A tramp release system allows non-crushable material to bypass the rollers without damage. A user selectable gap can be easily set by the operator. The roll faces are hardened to 500 Brinell to increase the life and efficiency of the machine.

- Applications include: Fertiliser, Coal, Bath
- Uniform granular product

- Abrasion resistant rolls
- Reduces by compression

Bath Impactor

The Rocktec HSI Bath impactor is specifically designed to crush waste Alumina bath which can then be recycled and used in the Aluminum production process. A high reduction ratio is achieved by Tungsten tipped flails and Tungsten tipped anvils, these are set to determine the finished product size. The internal ledges combined with Tungsten tips/anvils provide high efficiency and durability.
